

### **ABSTRACT OF THE DISCLOSURE**

A demand dispatch system to provide stable fabrication loading. The system includes a risk database recording risk information for a demand and an allocation planning module.

5 The allocation planning module receives the demand, divides the demand into a low risk demand and a high risk demand according to the risk information, and then determines an expected quantity for a fabrication. The allocation planning module dispatches parts of the low risk demand and

10 the high risk demand to the fabrication according to the expected quantity and the risk information.
